DISCLAIMER: This calendar presents probabilistic risk elevation windows — NOT deterministic earthquake predictions. An elevated risk window means earthquake probability is statistically higher than the historical baseline during that period. It does NOT guarantee an earthquake will occur. Validated for Americas Pacific zone (Mexico, Peru, Chile) and Pacific Ring only. No claims are made for India, South Asia, Mediterranean or Middle East. Emergency decisions should never be based solely on this calendar.

RISK LEVEL LEGEND			
VERY HIGH (Score 6+)	HIGH (Score 5)	MEDIUM (Score 4)	MODERATE (Score 3)

All peak windows shown are 1-2 days BEFORE the exact planetary aspect, consistent with the Johnston timing principle confirmed in this study. Convergence score = number of validated aspects simultaneously active.

2026 Remaining Risk Calendar — June to December

Note: May 29-31 (Score 5 HIGH) window is active NOW — Americas Pacific and Pacific Ring primary zones.

2027 Complete Risk Calendar — January to December

2027 is a quieter year than 2026. No Score 5 or 6 windows are predicted. Maximum convergence score reaches 4 (MEDIUM). The most sustained period is November 4-14 — eleven consecutive days at Score 3.

Priority monitoring cell throughout 2027: Mexico Lat:20 Lon:-110 (Jalisco/Colima/Guerrero Pacific coast) remains the highest-risk cell in all Americas and should be monitored during all elevated convergence windows throughout 2027.

These windows were computed using Swiss Ephemeris with Lahiri Ayanamsa from the validated set of 30 planetary aspects. All peak windows shown are 1-2 days before exact aspect perfection per the Johnston timing principle confirmed in the accompanying research paper.
